

## The multifunctional USB Whiteboard Net

## meets *Interactive Whiteboard*

Today an interactive whiteboard is part of the standard equipment in many training and conference rooms. Most of these “electronic boards” are connected to the trainer’s PC via a USB connection.

- But what about the workstations of the individual participants who must restrict themselves to listening and looking?

With **videodidact® USB integration**, centralised use of the whiteboard becomes possible when this is connected directly to the videodidact system. Now all you need is a touch of a button on the videodidact keyboard and any participant’s image you like can be transmitted to the whiteboard. Now every individual participant can also work with and make a presentation with the aid of the whiteboard.

All the functions of videodidact systems such as for instance image transmission by each “presenter” to all participants, blanking participants’ screens to capture participants’ attention and much more besides are naturally also available.

In line with the usual videodidact philosophy, in the case of the **videodidact USB whiteboard connection** too, it’s a pure hardware function.

So any interactive whiteboard - irrespective of manufacturer, model and size - can be integrated into videodidact.

### Advantages at a glance:

- Central and efficient use of already existing or new interactive whiteboard
- Every participant can start his individual presentation over the whiteboard
- Independent of manufacturer, type and size of whiteboard
- Integration of projector and notebook
- Optimum viewing position for all participants with perfect image quality, even in the last rows
